Düsseldorf, September 2010

# Outline

- 1 Introduction
- 2 Preliminaries
- 3 Voting Theory
  - Fallback voting (FV)
  - Bucklin voting (BV)
  - Control
- 4 Results

# Voting

- Preference aggregation and collective decision-making.
- Political science, economics, social choice theory, and operations research.
- In computer science:
  - artificial intelligence (multiagent systems)
  - planning
  - similarity search
  - design of ranking algorithms

# Dealing with NP-Hardness

Worst-case complexity vs.

- approximation algorithms
- algorithms that are always efficient although not always correct
- algorithms that are always correct, but not always efficient
- average-case complexity
- parameterized complexity

# Parameterized Complexity

- Fixed-parameter tractability: Membership in FPT.
- Fixed-parameter intractability:

$$FPT = W[0] \subseteq W[1] \subseteq W[2] \dots$$

- Reductions from Dominating Set.

# How to Affect the Outcome of an Election

- The Bad Guy knows everybody else's votes.

# How to Affect the Outcome of an Election

- The Bad Guy knows everybody else's votes.
- The Bad Guy can have two different intentions:
  - to make a desired candidate win (constructive),
  - to prevent a despised candidate from winning (destructive).

# How to Affect the Outcome of an Election

- The Bad Guy knows everybody else's votes.
- The Bad Guy can have two different intentions:
  - to make a desired candidate win (constructive),
  - to prevent a despised candidate from winning (destructive).
- Computational barrier to prevent cheating in elections.
  - **Control:** The Chair modifies the election's structure.
  - **Bribery:** (Not considered here) An external agent bribes a group of voters.
  - **Manipulation:** (Not considered here) An evil coalition of voters strategically change their votes.

# Elections & Voting Systems

- Set of candidates and multiset of voters:
  - $C = \{c_1, \dots, c_m\}$ ,
  - $V = \{v_1, \dots, v_n\}$ .
- Voter preferences over  $C$  can be represented as
  - preference lists (rankings),
  - approval/disapproval vectors.
- Voting rule aggregates the preferences and outputs the set of winners:
  - unique-winner model,
  - nonunique-winner model.

# Control

- Candidate Control:
  - Adding candidates
  - Deleting candidates
  - Partition of candidates
    - With runoff
    - Without runoff

# Control

- Candidate Control:

- Adding candidates
- Deleting candidates
- Partition of candidates
  - With runoff
  - Without runoff

- Voter Control:

- Adding voters
- Deleting voters
- Partition of voters

# Control

- Candidate Control:

- Adding candidates
- Deleting candidates
- Partition of candidates
  - With runoff
  - Without runoff

- Voter Control:

- Adding voters
- Deleting voters
- Partition of voters

- Tie Handling:

- Ties eliminate (TE)
- Ties promote (TP)

# Example

**Name:** Constructive Control by Adding Voters.

**Instance:** An election  $(C, V \cup W)$ , a designated candidate  $c \in C$ , and a positive integer  $k$ .

**Parameter:**  $k$ .

**Question:** Is it possible to choose a subset  $W' \subseteq W$  with  $\|W'\| \leq k$  such that  $c$  is the unique winner of the resulting  $(C, V \cup W')$ ?

# Control

- Candidate Control:

- Adding candidates
- Deleting candidates

- Voter Control:

- Adding voters
- Deleting voters

# Contrast

## Table

*Number of resistances, immunities, and vulnerabilities to the 22 common control types.*

<i>Number of</i>	<i>AV</i>	<i>Llull</i>	<i>Copeland</i>	<i>Plurality</i>	<i>BV</i>	<i>SP-AV</i>	<i>FV</i>
<i>resistances</i>	4	14	15	16	$\geq 18$	19	$\geq 19$
<i>immunities</i>	9	0	0	0	0	0	0
<i>vulnerabilities</i>	9	8	7	6	$\leq 4$	3	$\leq 3$

# Fallback Voting

- Proposed by Brams and Sanver (2009).
- Line between acceptable and unacceptable candidates:

$$\{C_4, C_1\} \mid \{C_2, C_3, C_5, C_6\}.$$

# Fallback Voting

- Proposed by Brams and Sanver (2009).
- Line between acceptable and unacceptable candidates:

$$\{C_4, C_1\} \mid \{C_2, C_3, C_5, C_6\}.$$

- In addition each voter has a preference ranking, a tie-free linear ordering of all approved candidates:

$$C_4 > C_1 \mid \{C_2, C_3, C_5, C_6\}.$$

# Example for Fallback Voting

## Example

### Preferences:

- $v_1 = a > b > c > \{d, e\}$
- $v_2 = a > b > \{c, d, e\}$
- $v_3 = c > \{a, b, d, e\}$
- $v_4 = d > e > b > \{a, c\}$
- $v_5 = c > a > e > b > \{d\}$

# Example for Fallback Voting

## Example

### Preferences:

- $v_1 = a > b > c > \{d, e\}$
- $v_2 = a > b > \{c, d, e\}$
- $v_3 = c > \{a, b, d, e\}$
- $v_4 = d > e > b > \{a, c\}$
- $v_5 = c > a > e > b > \{d\}$

### Votes:

- $a \ b \ c \mid \{d, e\}$
- $a \ b \mid \{c, d, e\}$
- $c \mid \{a, b, d, e\}$
- $d \ e \ b \mid \{a, c\}$
- $c \ a \ e \ b \mid \{d\}$

# Example for Fallback Voting

## Example

### Preferences:

- $v_1 = a > b > c > \{d, e\}$
- $v_2 = a > b > \{c, d, e\}$
- $v_3 = c > \{a, b, d, e\}$
- $v_4 = d > e > b > \{a, c\}$
- $v_5 = c > a > e > b > \{d\}$

### Votes:

- $a \ b \ c \mid \{d, e\}$
- $a \ b \mid \{c, d, e\}$
- $c \mid \{a, b, d, e\}$
- $d \ e \ b \mid \{a, c\}$
- $c \ a \ e \ b \mid \{d\}$

	a	b	c	d	e
Level 1 score	2	0	2	1	0

# Example for Fallback Voting

## Example

### Preferences:

- $v_1 = a > b > c > \{d, e\}$
- $v_2 = a > b > \{c, d, e\}$
- $v_3 = c > \{a, b, d, e\}$
- $v_4 = d > e > b > \{a, c\}$
- $v_5 = c > a > e > b > \{d\}$

### Votes:

- $a \ b \ c \mid \{d, e\}$
- $a \ b \mid \{c, d, e\}$
- $c \mid \{a, b, d, e\}$
- $d \ e \ b \mid \{a, c\}$
- $c \ a \ e \ b \mid \{d\}$

	a	b	c	d	e
Level 2 score	3	2	2	1	1

# Bucklin Voting

- Each voter has a tie-free linear ordering of all candidates:

$$c_4 > c_1 > c_3 > c_5 > c_2 > c_6$$

# Bucklin Voting

- Each voter has a tie-free linear ordering of all candidates:

$$c_4 > c_1 > c_3 > c_5 > c_2 > c_6$$

- $score_{(C,V)}^i(c)$  = number of voters who rank  $c$  on level  $i$  or higher.
- $M_t = \lfloor n/2 \rfloor + 1$

# Bucklin Voting

- Each voter has a tie-free linear ordering of all candidates:

$$c_4 > c_1 > c_3 > c_5 > c_2 > c_6$$

- $score_{(C,V)}^i(c)$  = number of voters who rank  $c$  on level  $i$  or higher.
- $M_t = \lfloor n/2 \rfloor + 1$
- $score_B(c) = \min\{i \mid score_{(C,V)}^i(c) \geq M_t\}$
- Winner: The candidate with the lowest Bucklin score.

# Example for Bucklin Voting

## Example

### Preferences:

- $v_1 = a > b > c > d > e$
- $v_2 = a > b > c > e > d$
- $v_3 = c > b > a > d > e$
- $v_4 = d > b > e > a > c$
- $v_5 = c > a > e > b > d$

### Scores:

- $score_B(a) = 2$
- $score_B(b) = 2$
- $score_B(c) = 3$
- $score_B(d) = 4$
- $score_B(e) = 4$

$$score_{(C,V)}^2(a) = 3 < 4 = score_{(C,V)}^2(b)$$

## Conclusions and Open Questions

- The problems remain hard for the natural parameterization.
- What is the complexity if parameterized by the amount of action and the number of voters/candidates?
- Partition cases are still open.

# Thank you very much!
